Mean 10.987; Variance 4.759; scale 2.308 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Novel chemokines, e.g. thymus expressed chemokine - used for treating inflammatory conditions including asthma.
Claim 5; Rage 92-94; 202pp; English.

The present sequence encodes a human dendritic cell chemokine receptor. Antibodies which blind to the protein can be used in detecting or diagnosing various immunological conditions related to expression of the protein. The nucleic acid can be used for screening and isolating DNA clones for the chemokines, especially from other species. The chemokine can be used in the treatment of conditions associated with abnormal physiology or development, including
                                                                                                                                                                                                                                             /*tag= b

Productions are as therapeutic or diagnostic agents for conditions prods. for use as therapeutic or diagnostic agents for conditions involving the receptors.

Frample 3; Page 54-56; 100pp; English.

Example 3; Page 54-56; 100pp; English.

Two primers (066148, 066149) were used to amplify human genomic DNA purified from leukocytes. Approximately 1000 clones were isolated after the initial amplification reation and probed with sequences of the initial amplification reation and probed with sequences of specific for seven transmembrane receptors IDRR1, AT2R and R20.

Clones which did not hybridise were then chosen for sequence analysis. Three new clones were then chosen for sequence analysis. Three new clones were then chosen for sequence of seven transmembrane receptor segments. Two more primers (066151, 066152), were used to isolate a full length version of one of these clones designated V31 (See 066153). This is the sequence of exon 3 of the V31 genomic clone (along with partial intron sequences) and is the final exon of the clone. The TAG stop codon is found at costiling 1343-1245 of the sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DNA encoding seven trans:membrane receptors - used to develop prods. for use as therapeutic or diagnostic agents for conditions involving the receptors:

Example 2: Page 44-46; 100pp; English.

Example 2: Page 44-46; 100pp; English.

Two primers (Q66148, Q66149) were used to amplify human genomic DNA purified from leukocytes. Approximately 1000 clones were isolated after the initial amplification reation and probed with sequence specific for seven transmembrane receptors IBBR1, AT2R and R20. Clones which did not hybridise were then chosen for sequence analysis. Three new clones were then chosen for sequence coven transmembrane receptor segments. Two more primers (Q66151, Q66152, were used to isolate a full length version of one of these clones (this sequence) which was designated V31.

Example 3: Page 49-51: 100pp; English.

A human cDNA encoding the seven transmembrane receptor V31 was isolated by first amplifying a partial cDNA clone from a human tonsil cDNA library using two primers (066154, 066155). The resulting amplified products were probed using two radioactively labelled sequences (266156, 266157). A hybridising band was isolated from the gel and cloned. The resulting clone was named pV31-5° end (266158). A full length cDNA clone was isolated from a peripheral blood mononuclear cell library using V31 specific primers (266159, 266152). Clone PBMC75 was isolated and the V31 cDNA insert in the clone was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 tteeteetgaecetteeettetgggeetacagegggeeaa--gtee-tgggtetteggt 438

Claim 6; Page 15; 19pp; Japanese.

This sequence encodes human MIP-1 alpha/RANTES receptor (macrophage inflammatory protein 1 alpha/regulated on activation, normal 1 cell expressed and secreted). The human MIP-1 alpha/RANTES receptor protein may be used in a method for the screening of human MIP-1 alpha/RANTES receptor protein used to raffinity compounds. The MIP-1 alpha/RANTES receptor coding sequence may be included in an expression vector, preferably pcCR, and used to transform a CHO cell for use in the same method. The receptor protein can provide a preventive and treating agent for viral diseases, infectious diseases, tumours, allergy, diabetes, central diseases, hyperlipidaemia, hyperlipidaemia, osteoporosis, digestive ulcers,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Thorux R, Nacte K, Schall T;

Total III diagnosis and therapy of inflammation and other prods. for use in diagnosis and therapy of inflammation and other or cytokine-mediated disorders

Totokine-mediated disorders

Totokine is that of the C-C chemokine receptor gene which was isolated by PCR from PMA treated Hi60 cells using PCR primers whose sequence was designed to correspond to conserved sequences in two transmembrane regions of known cytokine receptors. The sequence can be used in therapeutic or diagnostic compsns. for inflammation and other cytokine mediated disorders.

MPF-1-alpha and RANTES receptor nucleic acid - used to develop

T products for the detection of these cytokine(s) and their receptors,

T products for the detection of these cytokine(s) and their receptors,

T products for the detection of these cytokine(s) and their receptors.

T particularly in inflammatory processes

C claim 1. Collumn 11-16; 12pp; English.

This nucleic acid sequence encodes a claimed receptor for marcophage

Inflammatory protein-1 alpha (MIP-1 alpha) and regulated upon

C claimed are: (1) a subsequence of the nucleic acid, having at least

12 contiguous nucleotides; (2) a cell transformed or transfected

With the nucleic acid; and (3) purified MIP-1 alpha/RANTES receptor

C polypeptide. The products can be used for detecting the MIP-1

C alpha/RANTES receptor and polymorphisms in physiological samples.

In addition, the receptor can be expressed and used to assay for

C miP-1a/RANTES is useful for monitoring the levels of these cytokines

C alpha/RANTES is useful for monitoring the levels of collowing the matri-

C in a patient. Such measurements are useful in following the matri-

C in a patient. Such measurements are useful in following the matri-

C in a patient of Anne and are useful in following the matri-

prods. for use as therapeutic or diagnostic agents for conditions involving the receptors.

Example 5; Page 58-60; 100pp; English.

Example 5; Page 58-60; 100pp; English.

Two primers (Q66148), Q66149) were used to amplify human genomic DNA purified from leukocytes. Approximately 1000 clones were isolated at fart the initial amplification reation and probed with sequences specific for seven transmembrane receptors ILBRI, AT2R and R20.

Clones which did not hybridise were then chosen for sequence analysis. Three new clones were identified that appeared to encode seven transmembrane receptor segments. Two more primers (Q6615), Q6615) were used to isolate a full length version of one of the human V31 clone (See Q66153). A fragment of the human clone was used to isolate this V31 genomic clone of the mouse from a library.

weful for treating inflammatory disorders, for detecting
neutrophil(s) and for isolating IL-8 receptor from liq.mixt.

Taim 2; Fig 1A-B; 74pp; English.

Monoclonal antibodies were raised against recombinant interleukin-8

(IL-8) receptor subtypes A and B from both human and rabbit sources

(R09950-53 encoded by 09949-52). The A subtype receptor (IL-8rb) is a

a high affinity receptor and the B subtype receptor (IL-8rb) is a

low affinity receptor. The monoclonal antibody (mAb) pref. binds to

the IL-8 binding domain thus blocking its activation. The mAbs are

useful for treating inflammatory disorders (see key words) and for

detecting the presence of neutrophils in a biological sample. The

mAbs are also useful in the isolation of IL-8 receptors from a mixture.

Recombinant mammalian interleukin-8 receptor - used for screening interleukin-8 bliding antagonists, used to treat inflammation Disclosure; Fig 1; 71pp; English.

Rabbit high affinity IL.8 receptor gene was isolated from rabbit Rabbit high affinity IL.8 receptor gene was isolated from rabbit produce a rabbit neutrophils and used as a source of poly(A)+ RNA, to produce a rabbit neutrophil cDNA library. 250,000 recombinant plaques were screened for those which hybridized to an antisense oligonuclectide (Q30015). This probe was designed based on the sequence derived from the second transmembrane domain of G-protein-coupled receptors. After terrilary screening, six plaques were isolated. The insert of one of these plaques, termed F3R was of 2.5 kb in size. This insert was sequenced. The protein deduced from the F3R clone demonstrates that it belongs to the family of G-protein-coupled receptors. The deduced protein sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human CCKR3 chemokine receptor coding sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated chemokine CCF8 and chemokine receptor CCKR3 - used to develop products useful for the diagnosis and treatment of conditions associated with abnormal physiology or development Claim 15; Page 60-62; 73pp; English.

This is the nucleotide sequence encoding a novel CCKR3 chemokine receptor isolated from a Th0-activated human T-cell cDNA library using the sequence amplified by primers T79097 and T79098 as a probe. The encoded protein can be used to screen for (ant)agonists that bind are useful in the treatment of conditions associated with abnormal physiology or development.

Claim 1: Page 114-115: 153pp; English.
A consensus DNA sequence (731336) codes for a novel human receptor (W03378), designated Eos L2 or C-C chemokine receptor 2 (CKR-3). It was deduced by comparing a genomic clone (731334) and a cDNA clone (731335) coding for CKR-3 proteins (W03376 and W03377) having slightly different sequences. Initial sequence information revealed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         250 ATCCTCTTTGTTCTTACTCTCCCATTCTGGGCAGTGAGTCATGCCACTGGTGCGTGGGTT

2 regions in which the cDNA sequence appeared to be shifted in frame, resulting in 2 sets of 4 contiguous amino acid differences in the predicted proteins. Further sequence analysis revealed only a single difference between the 2 open reading frames, the genomic clone coding for threonine at position 276 and the CDNA clone for serine.
                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Marmalian chemokine receptor-3 and related nucleic acids - useful tidentify receptor inhibitors to treat inflammatory disease, e.g. autoimmune disorders, certain cancers, etc.
Claim 1; Page 111-113; 153pp; English.
A genomic DNA clone (731335) codes for a novel receptor (W03377), designated Eos L2 or C-C chemokine receptor 3 (CKR-3), involved in leukocyte migration associated with inflammation. It was isolated from a human library constructed from eosinophils obtd. from a patient with hyper-eosinophils syndrome using a probe (p4 cDNA) encoding the MIP-lalpha/RANTES receptor. A CKR-3 genomic clone (731334) was also isolated, and a consensus sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                195 aaatacaggaggeteegaattatgaecaacatetaeetgeteaaeetggeeattteggae

library is a subtracted library derived from the UI-R-CO library, which is a subtracted library derived from the UI-R-AI and UI-R-AI and UI-R-AI libraries. The UI-R-AI library consisted of a mixture of individually tagged normalized libraries constructed from rat placenta, adult lung, brain, liver, Kidney, heart, spleen, ovary, and muscle. The UI-R-EI library consisted of a mixture of individually tagged normalized libraries constructed from 8, 12 and 18-day embryo. The tag is a string of 3-5 nucleotides present between the Not I site and the oligo-dr track which allows identification of the library of origin of a clone within the mixture. The subtracted library (UI-R-CI) was constructed as follows: PCR amplified cDNA inserts from UI-R-CO clones from which 3' ESTS had been derived was used as a driver in a hybridization with the UI-R-CO library in the form of single-stranded circles. The remaining single-stranded circles (subtracted library) was publicated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     VALUES 312 bp MRNA EST 06-FEB-1998 VALUES09.rl Soares mouse mammary gland NDMMG Mus musculus cDNA clone 1244224 5' similar to SW:CRR6_HUMAN P51684 C-C CHEMOKINE RECEPTOR AA790757
                                                                                                                                                                                                                                                                                                                                                                                                        hydroxyapatite column chromatography, converted to double-stranded circles and electroporated into DH10B bacteria (Life Technologies) to generate the UI-R-C1 library. This procedure has been previously described (Bonaldo, Lennon and Soares, Genome Research 6: 791-806,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       980
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   285
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    345

/organism="Homo sapiens"
/organism="Togan eye; Vector: lambda gt10; Site_1: ECORI;
Site_2: ECORI; The library used for sequenching was a
sublibrary derived from a human retina cDNA library.
Inserts from retina cDNA library DNA were isolated,
randomly primed, PCR amplified, size-selected, and cloned
into lambda gt10. Individual plaques were arrayed and
used as templates for PCR amplification, and these PCR
products were used for sequencing."

/note="Organ: pooled; Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I; Site_2: Eco RI; Equal amounts of plasmid DNA from three normalized libraries (fetal lung NbHL19W, testis NHT, and B-cell NCI_CGAP_GCB1) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 227480-302087, 682632-687239, 726408-728111, and 722096-731399. Subtraction by Bento Soares and M. Fatima Bonaldo."
